

Web Services

Galileo Web Services (GWS) is part of the Galileo Developer Tools suite of professional services which also comprises XML API Desktop and XML Select. Web Services is an application program interface (API) that helps you build an interface such as a website, connected to Galileo. Through GWS, you can easily integrate Galileo travel content with your own systems to create your own website and grow your business.

Web Services enables clients to seamlessly integrate applications with the Galileo system to create powerful desktop and web based booking applications. GWS client applications can be deployed in any environment that

supports HTTPS and in addition, a wide variety of languages, technical help documentation, code samples, test pages and developer toolkits are available to the customer to expedite the development process..

To discover more about how Web Services functionality can help you develop your businesses full potential and more about Galileo's extensive range of professional services and technical support for Developers please go to:

<http://ais.galileo.com>

Why use Web Services?

Saves Time:

- Access to the XML interface is obtained via the Internet so customers can start developing immediately when they receive login credentials.
- Access to 'Encapsulated Business Logic Services' (eBLS) which package together the most commonly used transactions enables significant savings on development time.
- Accelerates the time to market for new products, offering clients a valuable competitive advantage.

Easy to use:

- GWS applications use XML - an industry standard method of transferring data which is extremely familiar to developers, thus saving development time for clients.
- Comprehensive technical documentation and samples available on line.

Reduces Costs:

- There is no need for investment in additional software or for installation and maintenance of a dedicated line as access is obtained via the web.
- All Galileo Web Services are completely platform independent, enabling clients to run their own application on any operating system that supports web services.
- Customers select their preferred Internet Service Provider rather than just one that runs a line to Galileo.

Increases Efficiency:

- Galileo travel content can be readily integrated with clients own systems and databases to flexibly serve clients particular needs and offer them an extended range of products.
- Clients can develop their own online real-time web booking engine that requests travel content information directly from the Galileo host and translates it back for the user to display and review.

Web Services at a glance:

- No additional software installation is required as connections to the CRS are through the internet.
- Direct access to all Galileo content and functionality on the host.
- Complete Platform independence
- A dedicated Galileo Web Services expert team is available to support and assist Developer clients worldwide.

Our 3C Program ensures that each customer's capacity requirements are identified prior to starting development and remain closely monitored during the development life cycle right through to deployment on the live system. During development a customer can choose to have as many conference calls as they wish to consult with our API technical experts.

- CRS Communications Components hosted by Galileo.

Technical Requirements

Galileo Web Services conforms to the following industry standards and universal protocols:

- Message Envelope - SOAP 1.1 and SOAP 1.2 <http://www.w3.org/TR/SOAP/>
- Message Transfer - HTTP 1.0 and HTTP 1.1 <http://www.w3.org/Protocols/>
